Abstract

This study highlights the effectiveness of mouthwash compared with the gel Dentomer on some microbial strains of oral streptococci: mitis, mutans and oralis. Mitis and mutans strains of oral streptococci are sensitive to mouthwash DENTOMER and insensitive to the DENTOMER gel, while St oralis is resistant to both antiseptics that were tested. Dentomer mouthwash can be used as a preventive method, being effective against plaque accumulation.

Key words: mouthwash, oral streptococci, prevention
